

Group symbol: **2**

Team: **1**

Project title: **ListItUp**

Team members (*filled by PM, Team Leader*):

No	Name	Surname	Student ID	Role
1	Carmelo	Romero Pérez	293936	<i>PM, Team Leader</i>
2	Álvaro	Puebla Ruisánchez	293867	<i>Team member</i>
3	Carmen	Gutiérrez Sánchez	293906	<i>Team member</i>
4	David	Sosa Domínguez	293885	<i>Team member</i>
5	Diego	García Agrelo	293939	<i>Team member</i>
6	Miryam	Merchán León	293907	<i>Team member</i>

2. Requirements specification (S2)

2.1. Functional Requirements Specification

In this section, provide the table for functional requirements, including symbol, type (e.g. business logic, user interface, data exchange, etc.) description, significance (MoSCoW) and source (Stakeholder).

The requirements are structured around five domains: user account management, list and item management, social interaction, content discovery, and platform administration. Must-have requirements constitute the minimum viable set for the pilot release; Should-have requirements extend the experience without blocking the first release.

MVP Functional Requirements: core features (Must = critical, Should/Could = less critical)

Symbol	Type	Description	Significance	Source
FR1	User Interface / Authentication	Social Login: Users register and log in via Google or GitHub using OAuth 2.0. No platform-specific password is required.	Must	E1 - Casual Users E2 - Verified Creators
FR2	Business Logic / User Management	User Profile: Each user has an editable public profile with a username, biography, and profile picture. Verified creators additionally display a badge.	Must	E1 - Casual Users E2 - Verified Creators
FR3	Business Logic	Create a List: Authenticated users can create and publish a curated list with a title, description, cover photo, and public/private visibility.	Must	E1 - Casual Users E2 - Verified Creators
FR4	Business Logic / Data Management	Manage Items: Users can add, edit, reorder, and delete items within a list. Each item supports a title, short description, external URL, and optional photo.	Must	E1 - Casual Users E2 - Verified Creators
FR5	User Interface / Search	Discovery and Search: The platform offers a category-based feed of public lists and a keyword search filterable by category and sortable by relevance or recency.	Must	E1 - Casual Users E2 - Verified Creators
FR6	Business Logic / Social Interaction	Social Interactions: Authenticated users can follow others, like lists, post comments, and save lists to a personal collection.	Must	E1 - Casual Users E2 - Verified Creators
FR7	Business Logic / Moderation	Reporting and Moderation: Users can report lists, items, or comments. Administrators can review reports and delete any content from a dedicated panel.	Must	E1 - Casual Users E3 - Administrators
FR8	Data Exchange / Notifications	Notifications: The system sends in-app notifications for likes, comments, and new posts from followed creators. Key events also trigger email notifications via a third-party provider.	Should	E1 - Casual Users E2 - Verified Creators E4 - API Providers
FR9	User Interface / Analytics	Creator Analytics: Verified creators have access to a private dashboard showing per-list statistics: views, saves, likes, and link clicks, updated daily.	Should	E2 - Verified Creators

2.2. Non-Functional Requirements

In this section provide the table for non-functional requirements that includes symbol, type (e.g., efficiency, standards, constraints, etc.), description, significance (MoSCoW) for the project, source (Stakeholder). Each requirement should also have specified a verification method - a description of a confirmation method whether a requirement has been fulfilled or not in the most measurable and objective way.

Key non-functional requirements derive from the project's technological, legal and organizational context. These include security (campus SSO, encryption), performance and scalability, accessibility and audit compliance, and deployment constraints. Metrics and verification methods are specified to ensure measurable quality.

Symbol	Type	Description	Significance	Source	Verification method
NF1	Performance / Efficiency	Page Load Time: Primary pages must fully render within 3 seconds on a standard broadband connection, measured as Time to Interactive (TTI).	Must	E1 - Casual Users E2 - Verified Creators	Verification: Run Lighthouse on the three core pages from a cold cache; all TTI values must be below 3 seconds.
NF2	Reliability / Availability	System Uptime: The platform must maintain at least 99.5% uptime throughout the pilot period.	Must	E1 - Casual Users E3 - Administrators	Verification: Monitor uptime via UptimeRobot with 1-minute polling; compute the monthly ratio at the end of the pilot and confirm it meets or exceeds 99.5%.
NF3	Security / Legal	HTTPS and GDPR Compliance: All communication must be encrypted via TLS 1.2 or higher. The platform must support user rights under GDPR/RODO and display a cookie-consent banner on first visit.	Must	E1 - Casual Users Legal - GDPR	Verification: Manually confirm that account deletion removes all user data, that the cookie banner appears before non-essential cookies are set, and that users can export their personal data.
NF4	Usability / Compatibility	Responsiveness and Usability: The UI must work across the two most recent versions of Chrome, Firefox, and Safari on desktop and mobile. At least 80% of pilot users must complete the create-and-publish-list task without assistance.	Must	E1 - Casual Users E2 - Verified Creators	Verification: Run a manual test suite across all target browsers and viewports. Conduct a usability session with at least 5 first-time users and record the task completion rate (target $\geq 80\%$).

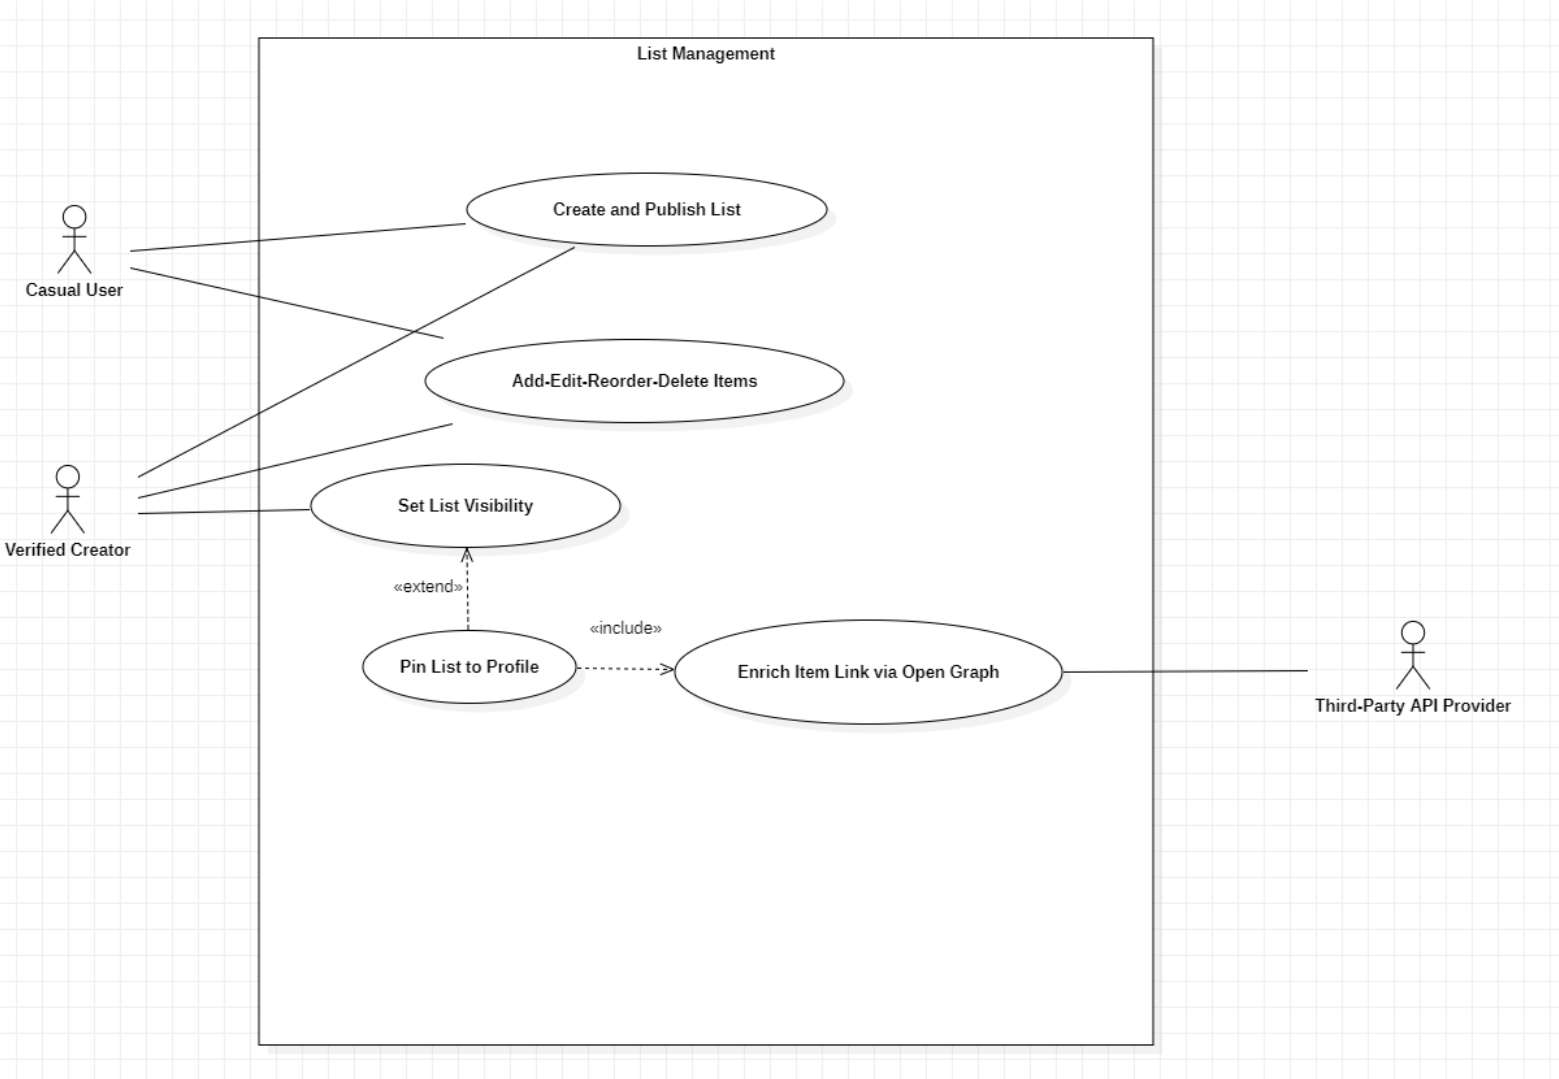

2.3. Use Case Diagram

You should prepare the use case diagram in UML 2.5 depicting the roles of stakeholders who are users of the project. It should also present the high-level concept of system usage divided into modules. Use case diagram should not cover common business logic (e.g. registration and logging in, CRUD operations).

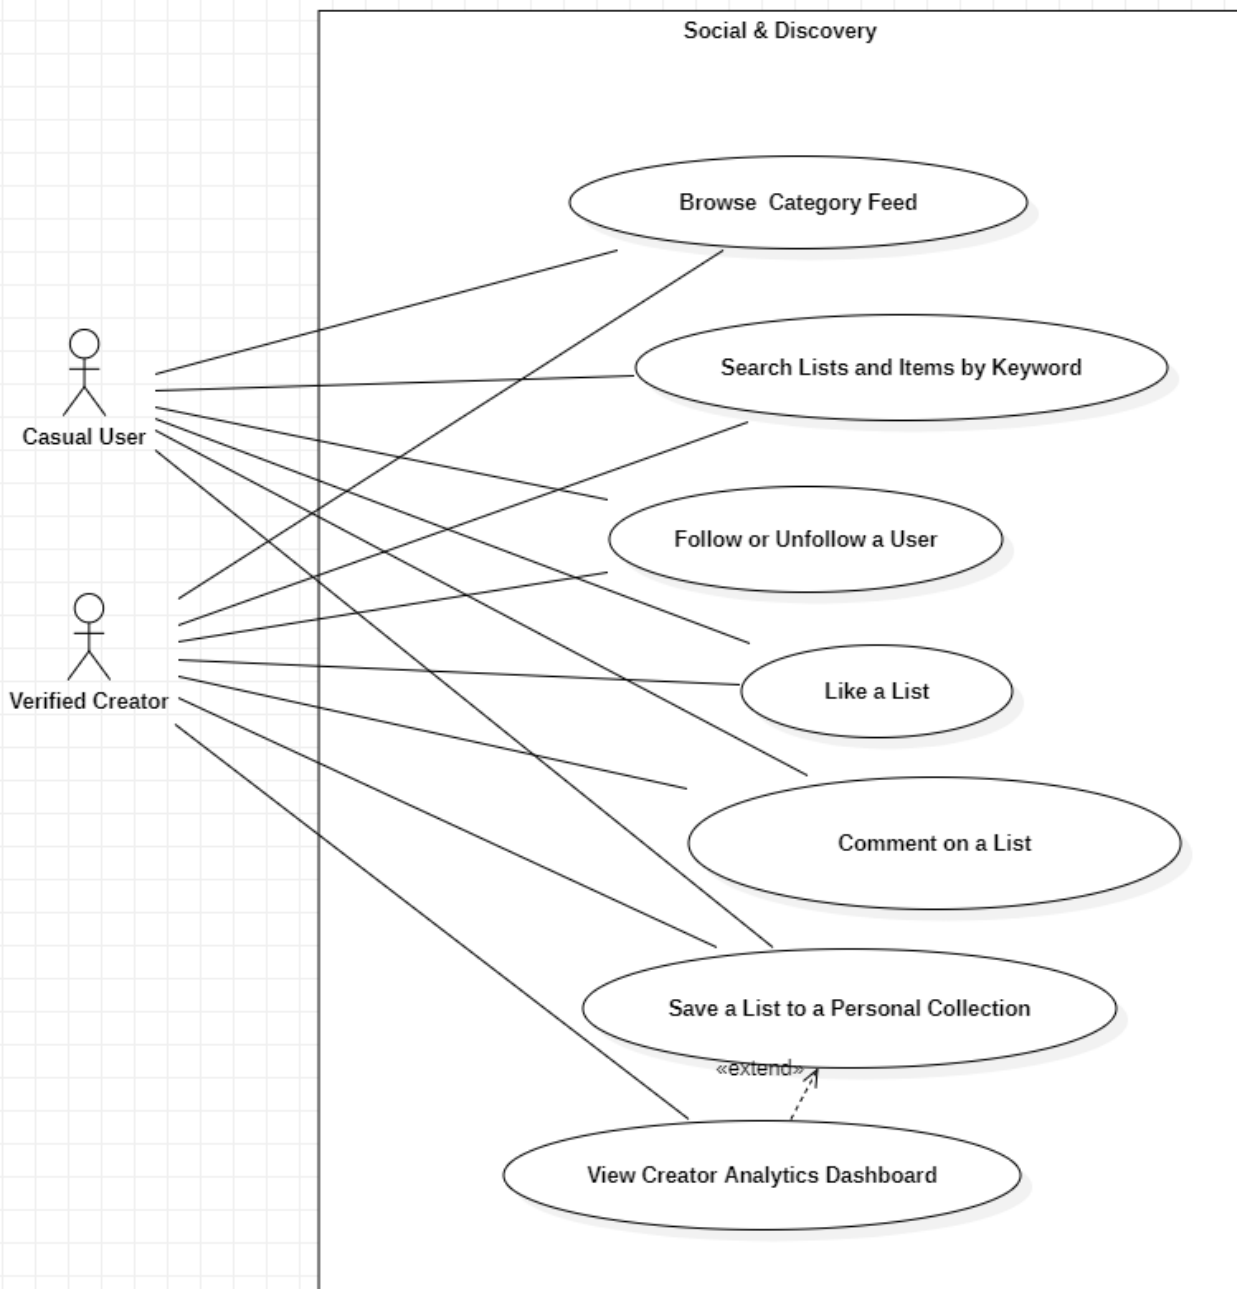

Actor	Description
Casual User (E1)	A registered standard user who browses, creates, and interacts with content. Primary actor across all four modules.
Verified Creator (E2)	Extends Casual User with exclusive access to the Creator Analytics Dashboard and the ability to pin lists to their profile. Modelled using <<extend>> relationships.
App Administrator (E3)	A privileged operator responsible for platform moderation. Interacts exclusively with the Administration module.
Third-Party API Provider (E4)	An external system actor representing services consumed by the platform: OAuth provider, Open Graph metadata service, image host, and transactional email provider.

Module	Use Cases	Actors
List Management	UC1: Create and Publish List UC2: Add / Edit / Reorder / Delete Items UC3: Set List Visibility UC4: Pin List to Profile <<extend>> UC5: Enrich Item Link via Open Graph <<include>>	UC1-UC3: Casual User, Verified Creator UC4: Verified Creator only UC5: Third-Party API Provider (system)
Social & Discovery	UC6: Browse Category Feed UC7: Search Lists and Items by Keyword UC8: Follow / Unfollow a User UC9: Like a List UC10: Comment on a List UC11: Save List to Personal Collection UC12: View Creator Analytics Dashboard <<extend>>	UC6-UC11: Casual User, Verified Creator UC12: Verified Creator only
Notifications	UC13: Receive In-App Notification UC14: Receive Email Notification <<include>>	UC13: Casual User, Verified Creator UC14: Third-Party API Provider (system)
Administration	UC15: Review Content Report Queue UC16: Delete List / Item / Comment UC17: Submit Content Report (initiation)	UC15-UC16: App Administrator UC17: Casual User, Verified Creator (initiates); App Administrator (processes)
