

Lab 2. Accounts configuration

IT Infrastructure Management (W04IST–SI0826G)

Wojciech Thomas

Spring 2026

1 Objectives

1. Configure users and groups locally and in Active Directory

2 Exercises

2.1 Task 1. Create user accounts in Active Directory

1. Run VirtualBox. Start the virtual machines DC1 and CL1.
2. Log in to DC1 as `contoso\Administrator` with password `P@ssw0rd`.
3. Open Server Manager. Click on **Tools** and select **Active Directory Users and Computers**.
4. Create a new user account named **John Doe** with username `jdoe` and password `P@ssw0rd`.
5. Login to CL1 as `contoso\jdoe` with password `P@ssw0rd` and verify that the login is successful.
6. Change the John Doe's display name to **John D.** and verify that the change is reflected in Active Directory Users and Computers.
7. Log in to CL1 an again as `contoso\jdoe` and verify that the display name is shown as **John D.** in the login screen.
8. Repeat the steps above to create account for **Jane Doe** using console Active Directory Administrative Center.
9. On DC1 open PowerShell and run commands to manage user accounts:

```
Get-Command *User # Find the command to create user account
Get-Help ____User # Display help for the command
Get-Help ____User -Examples # Display examples for the command
Get-Help ____User -Online # Display online help for the command
```

Using the commands above, create a few user accounts for your classmates and verify that they can log in to CL1. Specify not only the username and password, but additional information such as display name, description, etc. Specify membership in the **Domain Users** group.

10. In graphical Active Directory Users and Computers, verify if accounts created using PowerShell are visible and have the correct properties. Change some of the properties and verify that they are reflected in PowerShell.
11. In PowerShell display created user accounts and their properties. Use filtering to display only accounts with specific properties, e.g. display name containing **Doe** or accounts created in the last 7 days.

2.2 Task 2. Create user accounts locally

1. Log in to CL1 as **contoso\Administrator** with password **P@ssw0rd**.
2. Open Computer Management. Click on **System Tools > Local Users and Groups**
3. Create a new user account named **John Local** with username **johnlocal** and password **P@ssw0rd**.
4. In PowerShell, find the command to create local user accounts and create a few accounts for your classmates. Specify not only the username and password, but additional information such as display name, description, etc. Specify membership in the **Users** group.
5. Sign out from CL1, and sign in using created local accounts.

2.3 Task 3. Create groups in Active Directory

1. In Active Directory Users and Computers, create a new group named **Lab2 Group** with group name **lab2group** and description **Group for Lab 2**.
2. Add John Doe to the **Lab2 Group**.
3. In PowerShell, find the command to create groups in Active Directory and create a few groups for your classmates. Specify not only the group name, but additional information such as description, etc. Add some of the created user accounts to the groups.

2.4 Task 4. Create local groups

1. In CL1, create two local groups, one using Computer Management and another using PowerShell. Add some of the created local user accounts to the groups.

2.5 Task 5. Administrators

1. In Active Directory Users and Computers, add John Doe to the **Domain Admins** group. Log in to CL1 as **contoso\jdoe** and verify that you have administrative privileges:
 - can you create a new local user account? (you should be able to)

2. Sign in to DC1 as John Doe and Jane Doe. Is the result the same? Why?
Can John create new user accounts? Can Jane create new user accounts?
How can you explain the difference?
