

Lab 9 – My Solutions

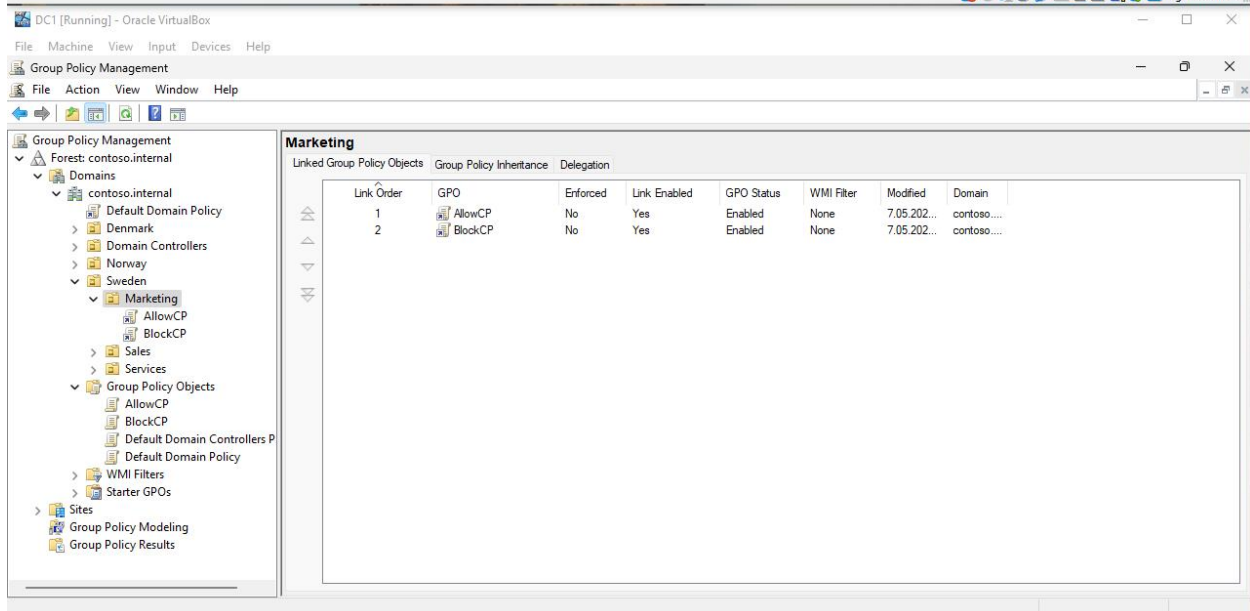

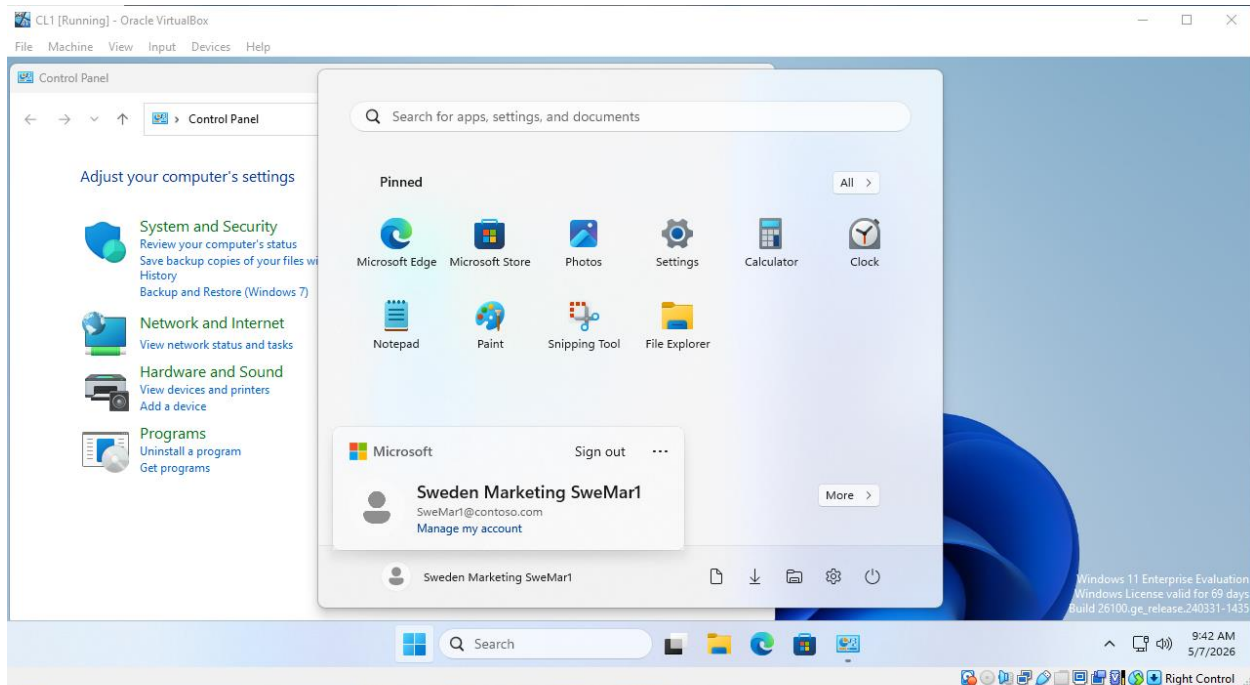

2.1: Order of Policy Application. Resolving Conflicts:

Marketing							
Linked Group Policy Objects		Group Policy Inheritance	Delegation				
Link Order	GPO	Enforced	Link Enabled	GPO Status	WMI Filter	Modified	Domain
1	BlockCP	No	Yes	Enabled	None	7.05.202...	contoso....
2	AllowCP	No	Yes	Enabled	None	7.05.202...	contoso....

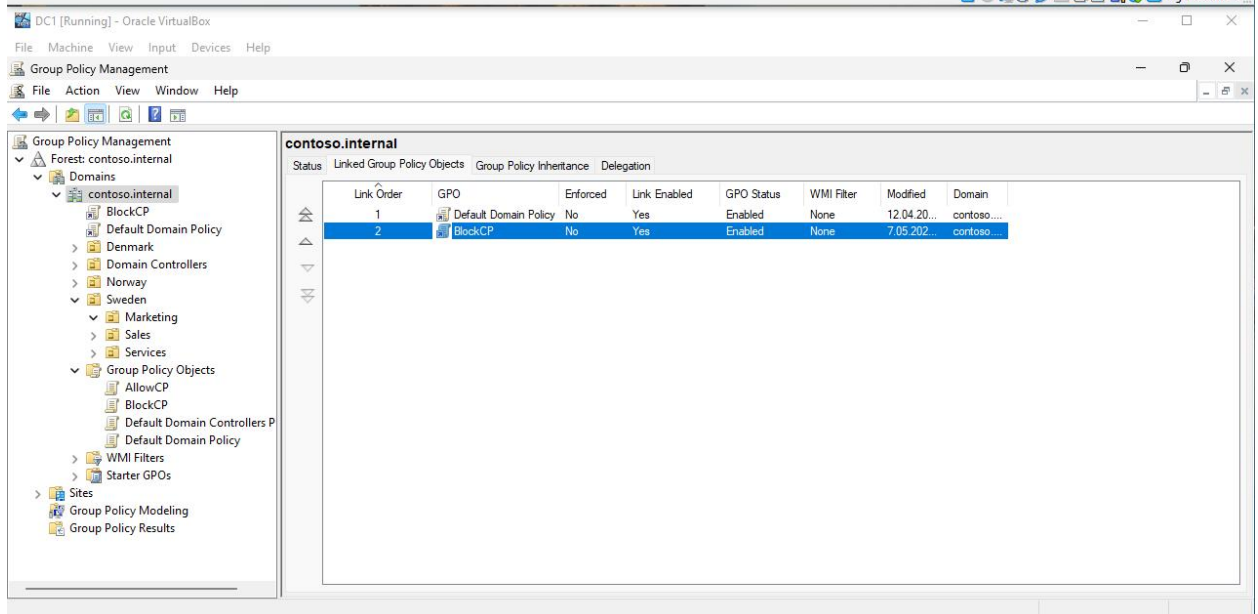

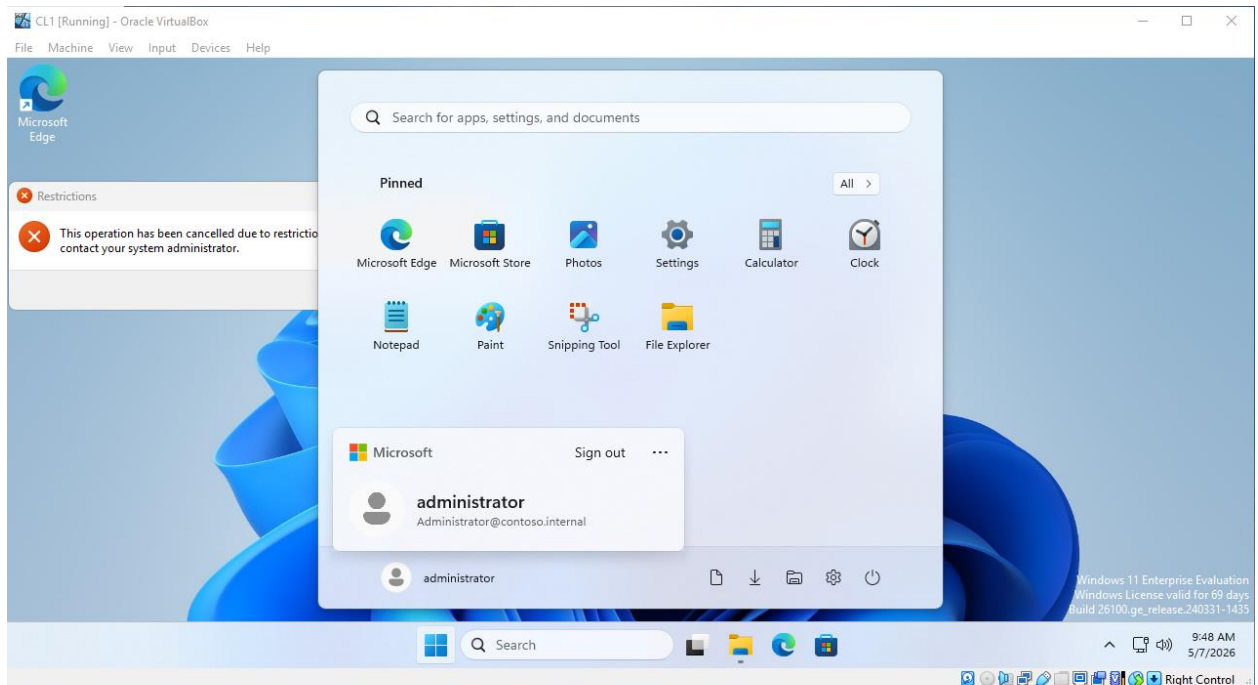

2.2: Inheritance of Policies:

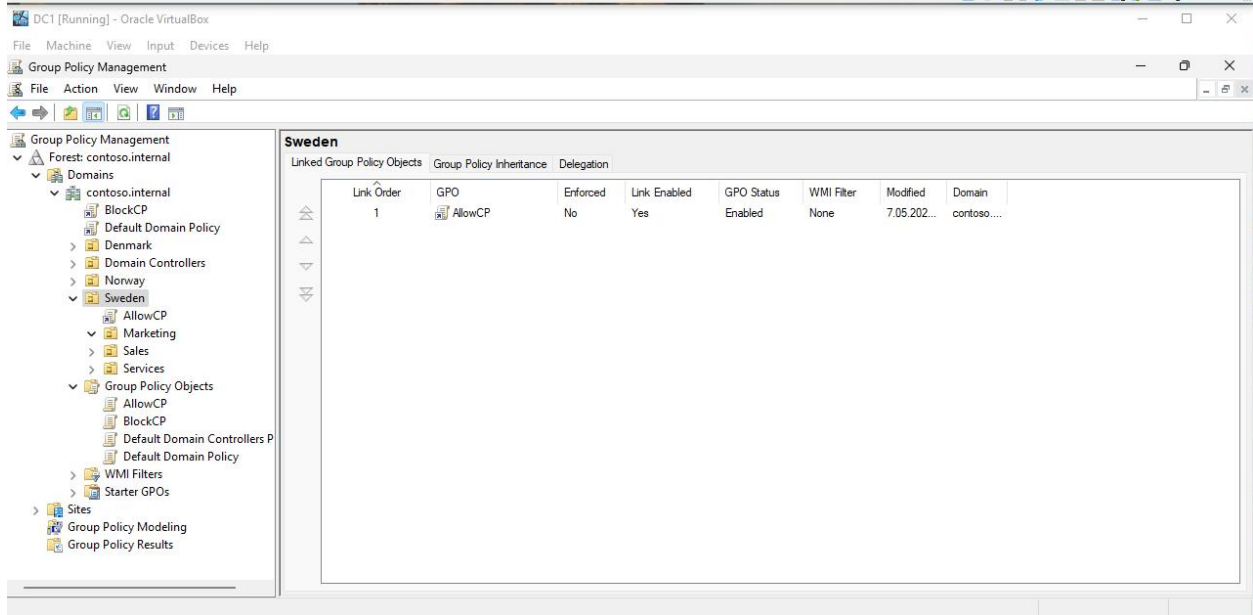

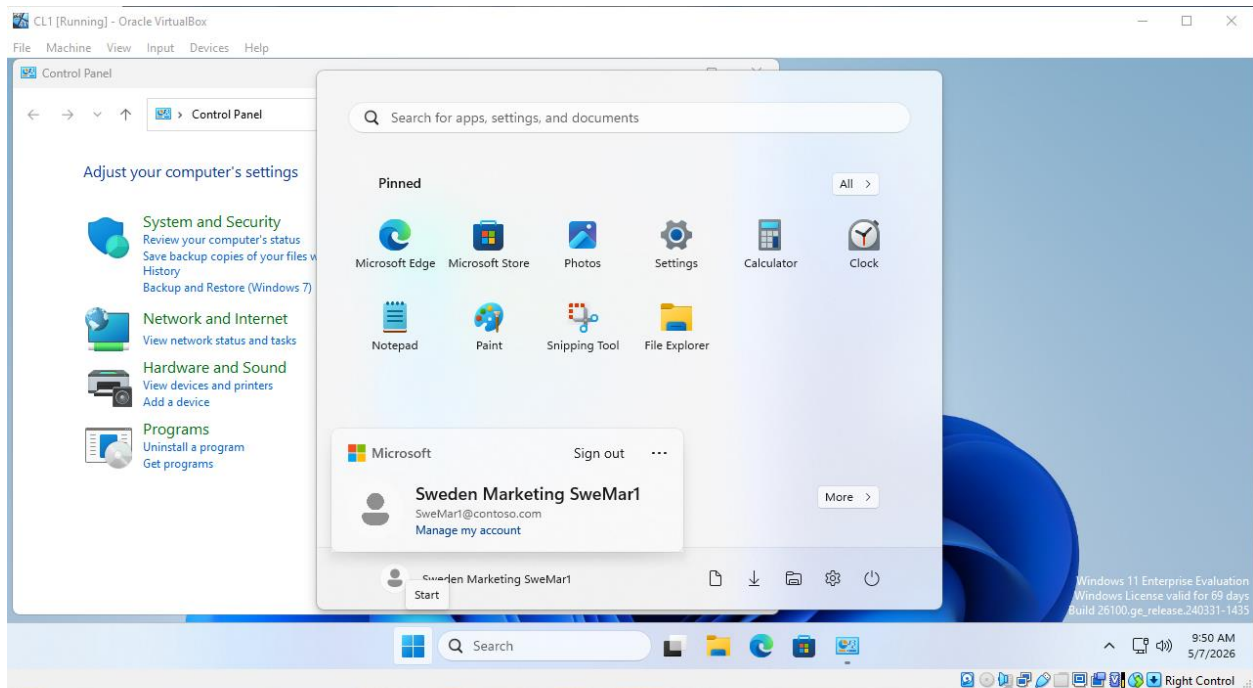

The screenshot displays a Windows 11 desktop environment running within an Oracle VM. The desktop background is the standard Windows 11 blue wallpaper. A Start menu is open, showing pinned applications: Microsoft Edge, Microsoft Store, Photos, Settings, Calculator, and Clock. Below these are other applications: Notepad, Paint, Snipping Tool, and File Explorer. The user is signed in as 'Sweden Marketing SweMar1' with the email 'SweMar1@contoso.com'. A notification in the top-left corner states: 'Restrictions: This operation has been cancelled due to restrictions set by your system administrator. Contact your system administrator.'

Below the desktop, the 'Group Policy Management' console window is open. The left pane shows the hierarchy: Forest: contoso.internal > Domains > contoso.internal. The right pane displays the 'contoso.internal' Group Policy Objects (GPOs) table.

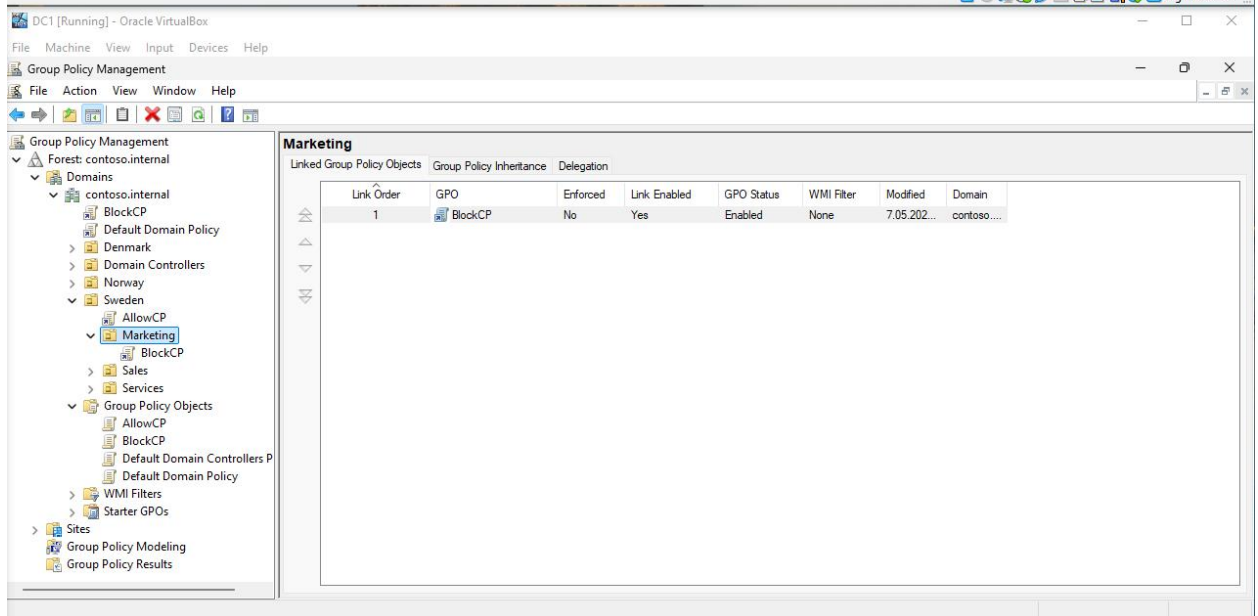

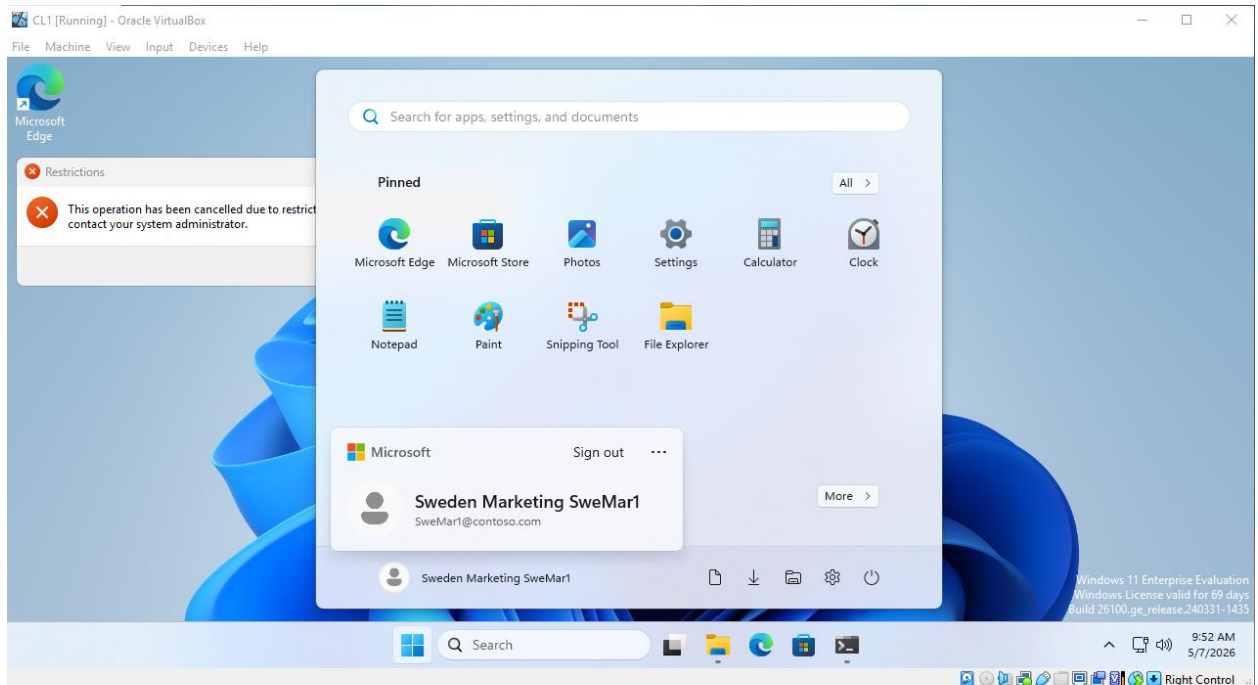

Link Order	GPO	Enforced	Link Enabled	GPO Status	WMI Filter	Modified	Domain
1	Default Domain Policy	No	Yes	Enabled	None	12.04.20...	contoso...
2	BlockCP	No	Yes	Enabled	None	7.05.202...	contoso...

2.2.3

2.2.4

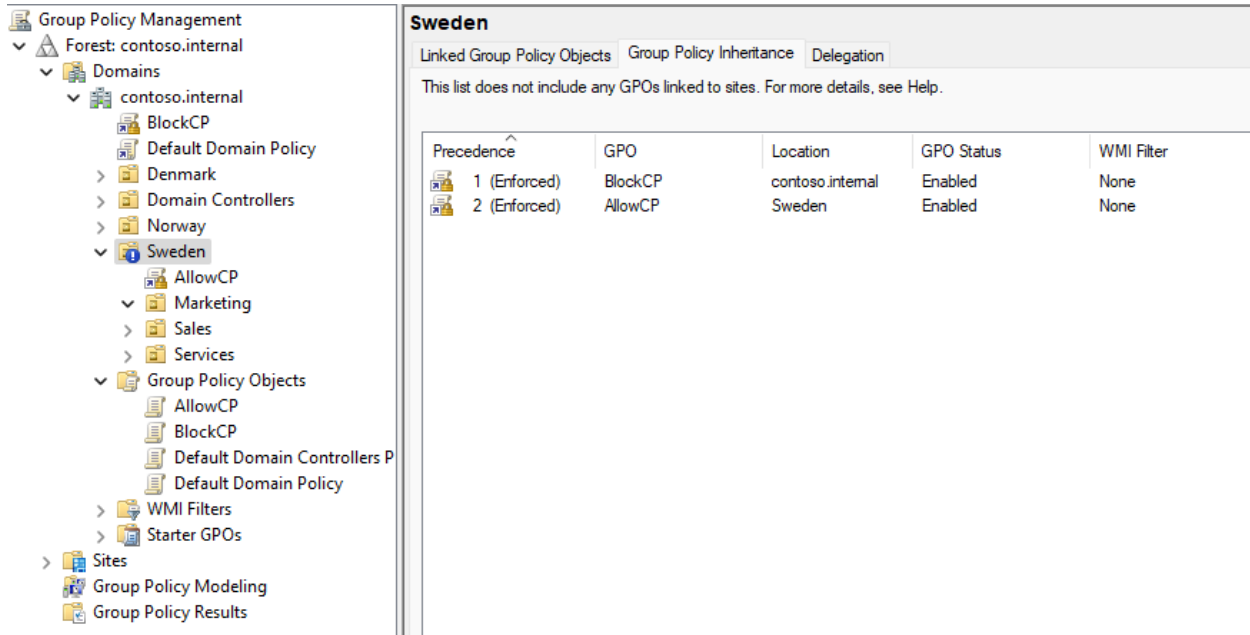

[illegible]

2.2.7

GPOs are processed from the **highest (domain)** level down to the **lowest (closest OU)**.

The **closest OU's GPO takes the highest priority** - it overrides parent settings. In this case, BlockCP linked at Sweden/Marketing wins over AllowCP linked at Sweden.

2.3: Controlling Inheritance:

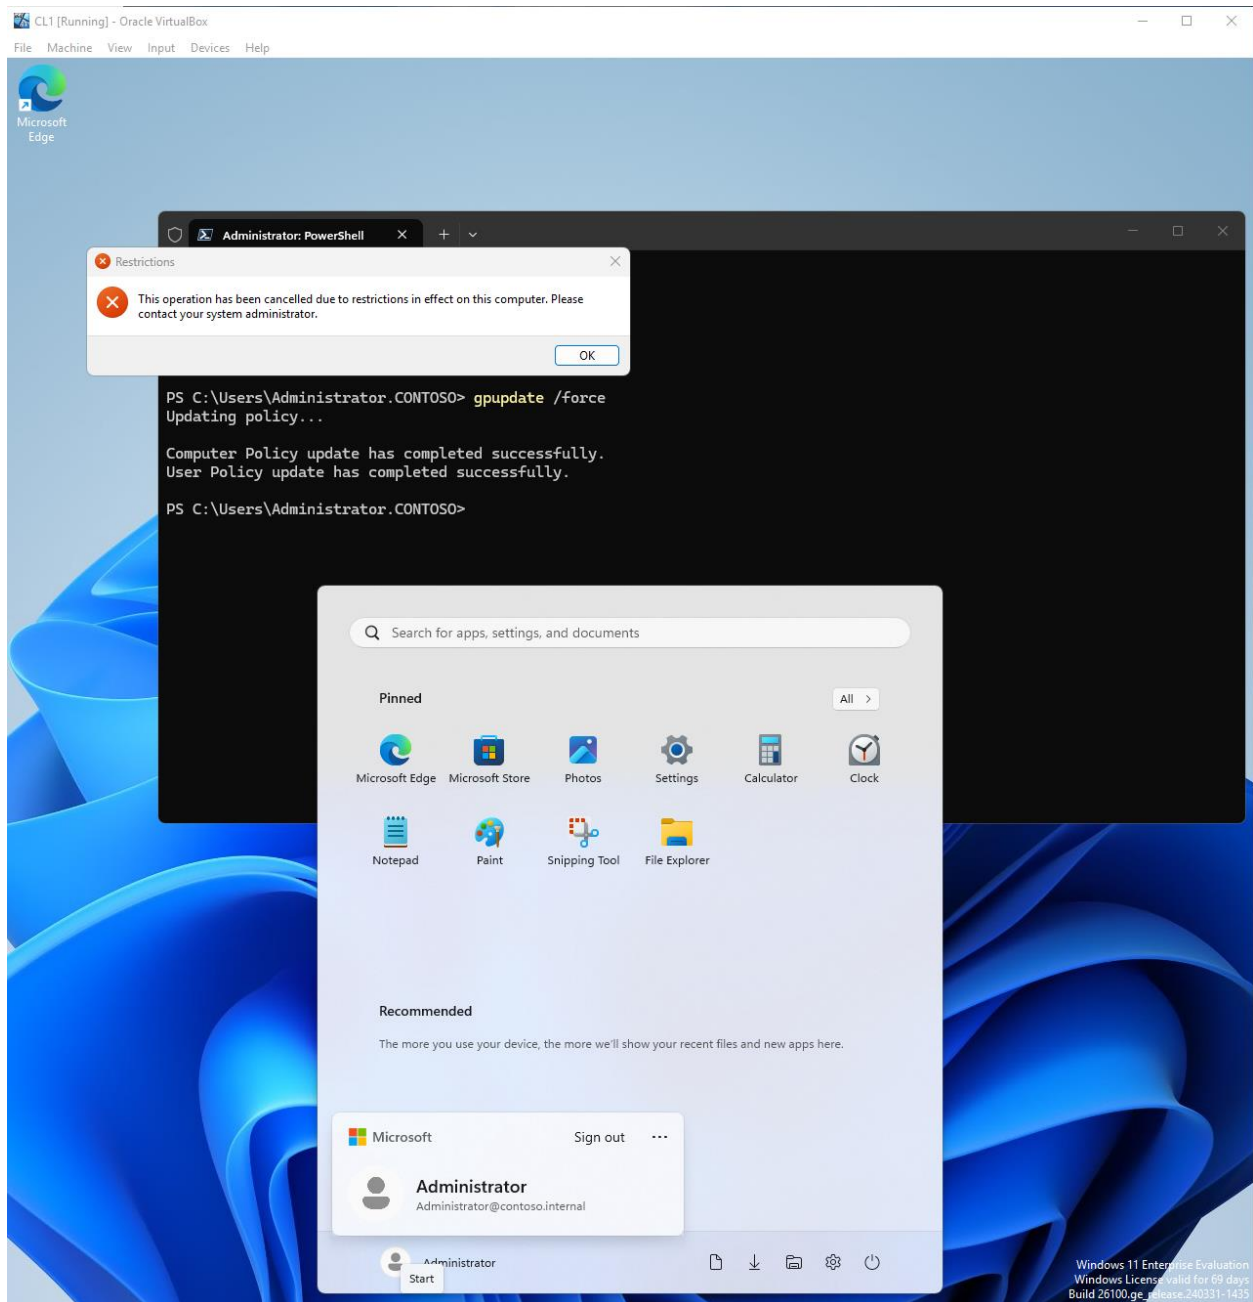

The screenshot shows the Group Policy Management console. On the left, the tree view is expanded to 'Forest: contoso.internal' > 'Domains' > 'contoso.internal' > 'Sweden'. The right pane shows the 'Group Policy Inheritance' tab for the 'Sweden' site. Below the tabs, a message states: 'This list does not include any GPOs linked to sites. For more details, see Help.' Below this is a table with the following data:

Precedence	GPO	Location	GPO Status	WMI Filter
1 (Enforced)	BlockCP	contoso.internal	Enabled	None
2 (Enforced)	AllowCP	Sweden	Enabled	None

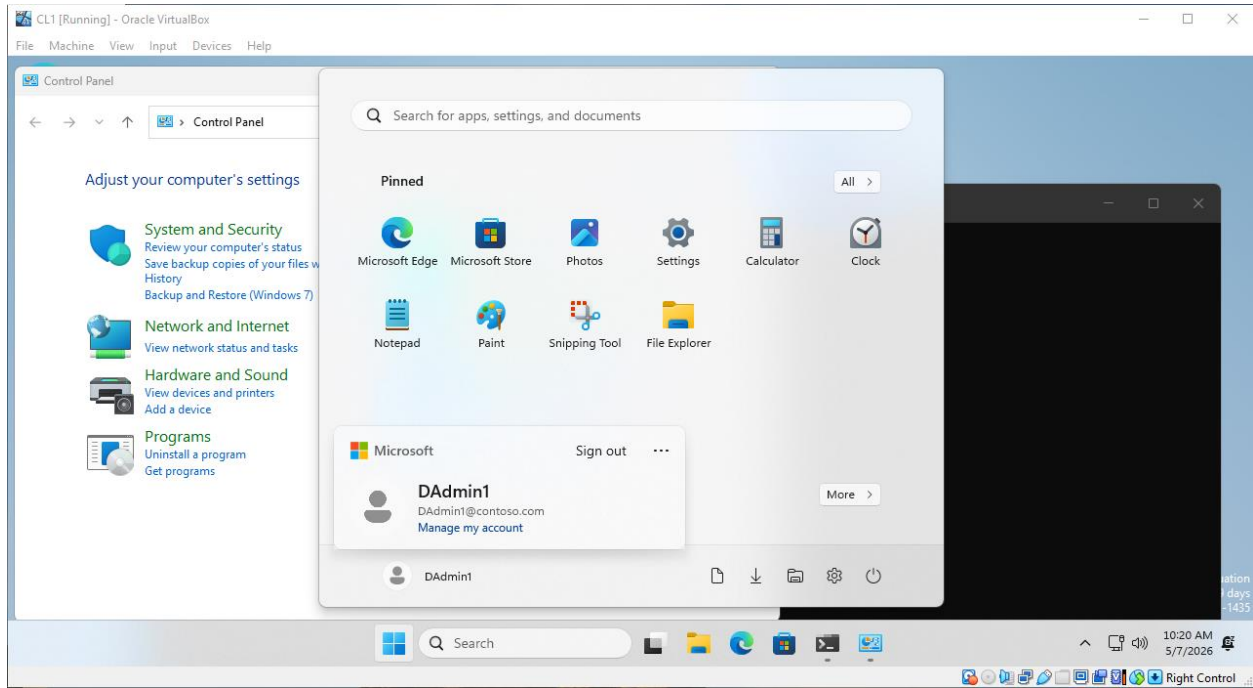

2.3.7

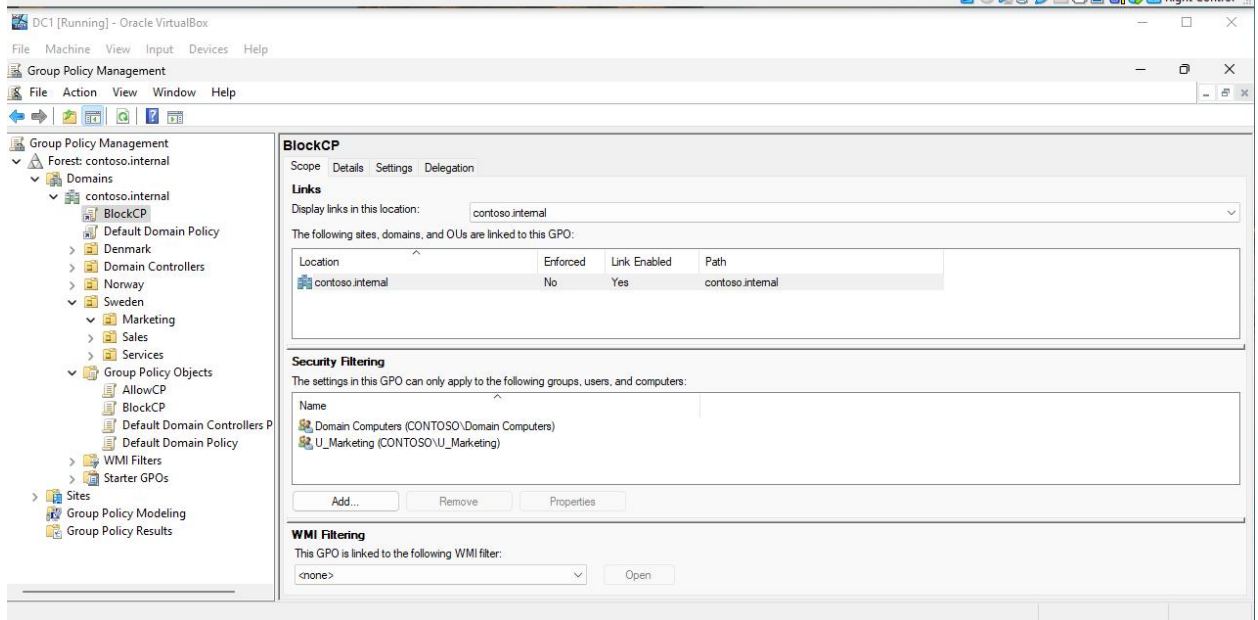

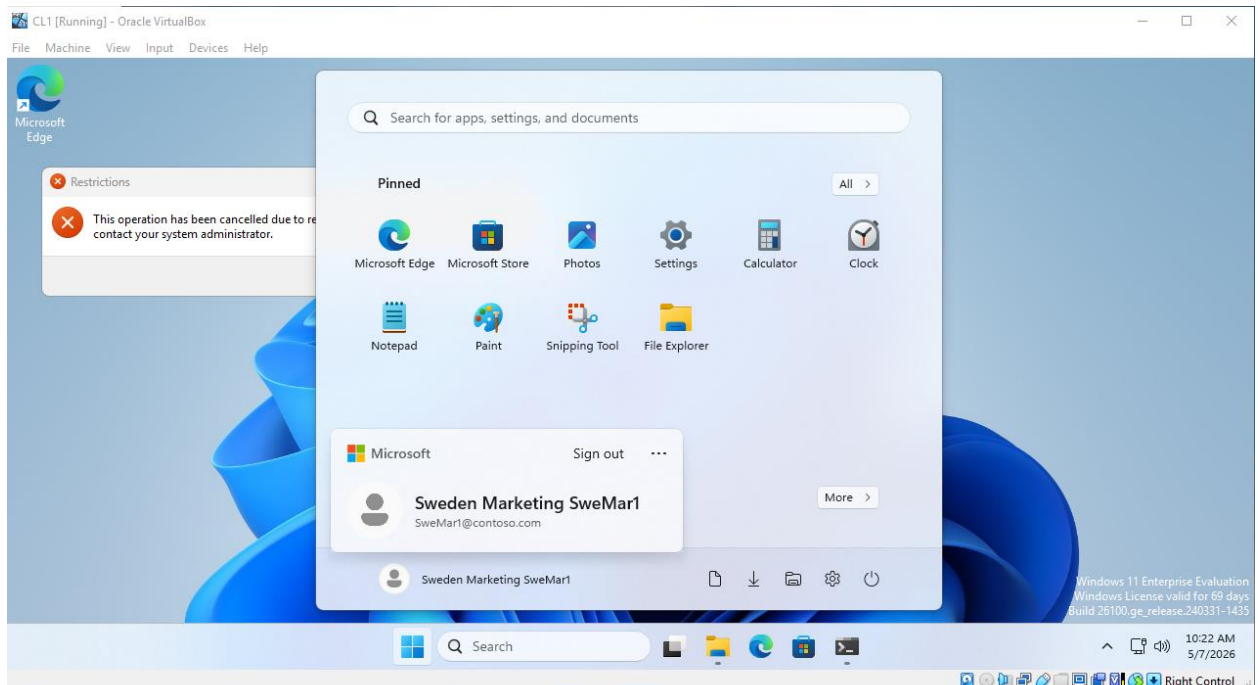

Normal inheritance: child OUs can override parent OU settings (closer = higher priority).

Enforced: the parent GPO setting cannot be overridden by child OUs, and it penetrates even through "Block Inheritance." When multiple enforced GPOs conflict, the **higher-level (more distant) enforced GPO wins** - the opposite of normal behavior.

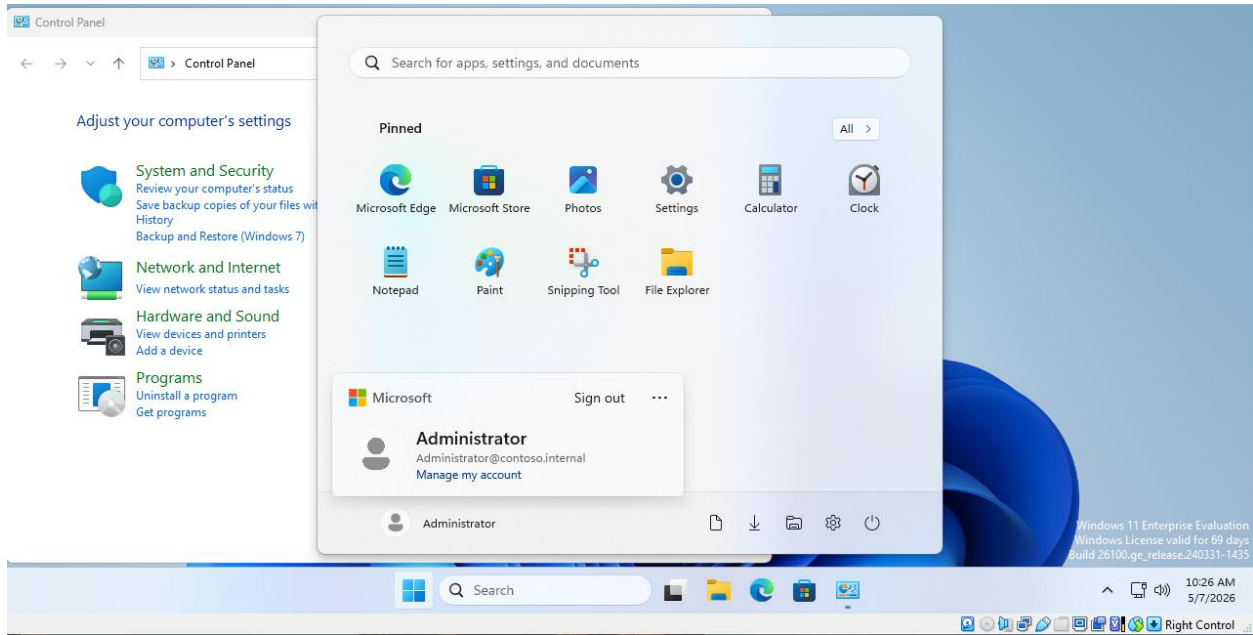

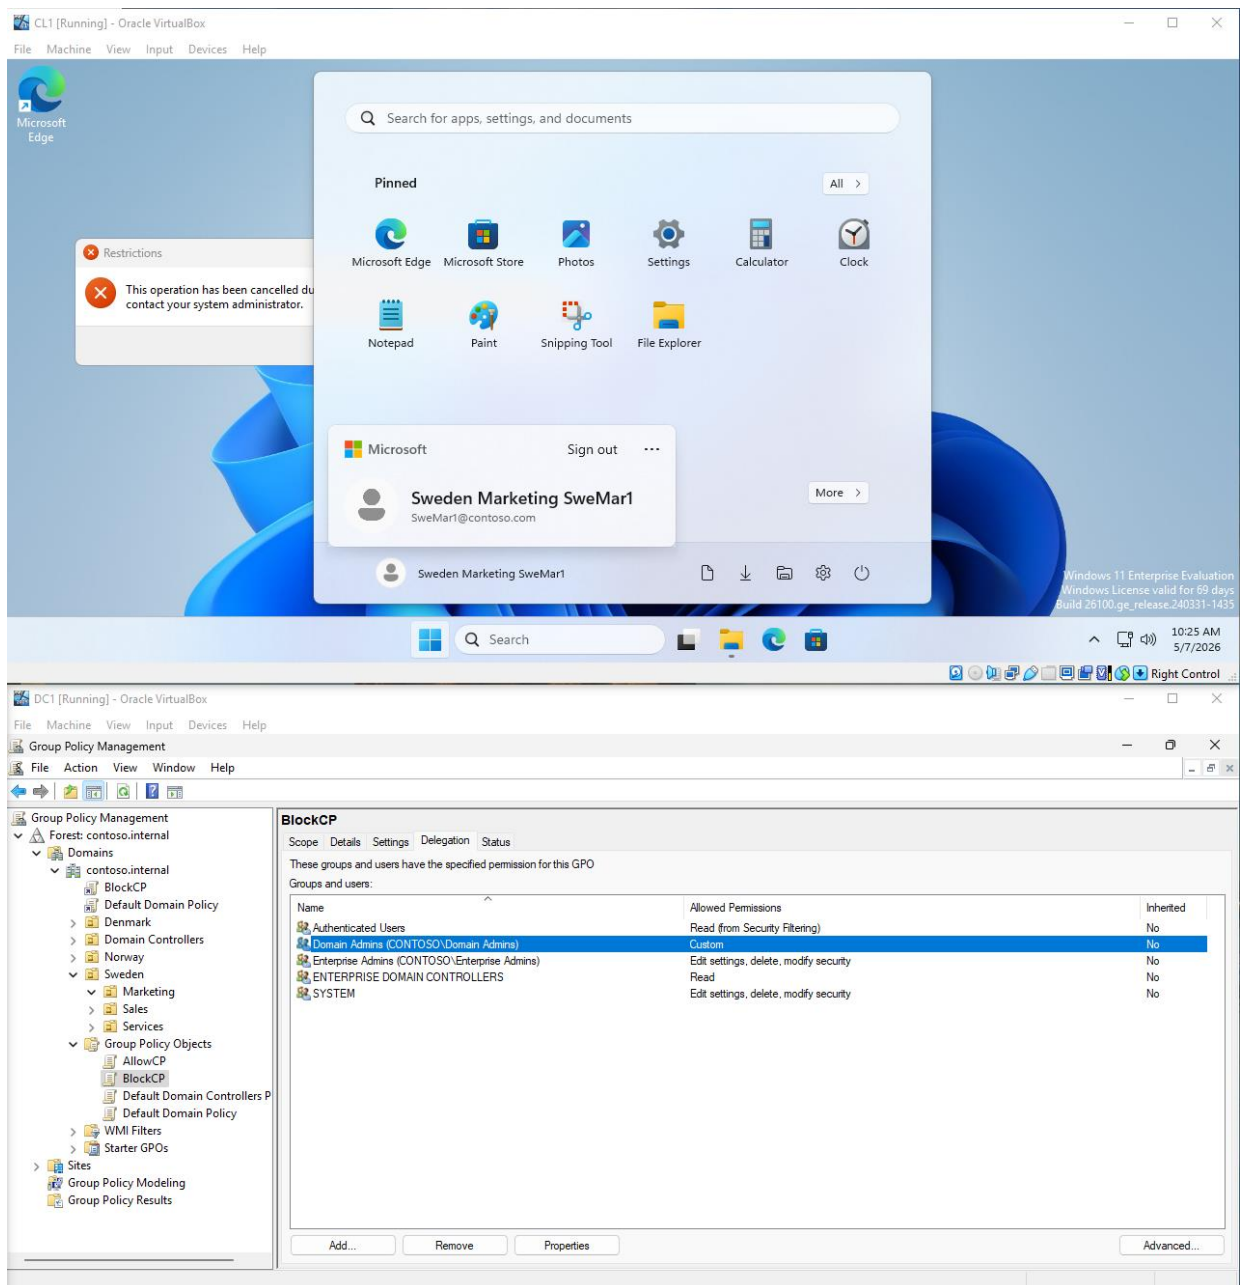

2.4: Filtering by Security Groups:

2.5: Filtering Using Permissions:

2.5.3

Method	Security Filtering (2.4)	Permission Deny (2.5)
How it works	Only listed groups receive the GPO	Listed group is explicitly denied the GPO
Best for	Targeting a GPO to specific groups	Excluding one group from an otherwise broad GPO
Risk	Easy to accidentally miss groups	Deny always overrides Allow - use carefully
Use case	"Apply only to Marketing"	"Apply to everyone except Admins"
