

WSP - Web System Programming

Laboratory 03 – HTML 2

Programming in HTML5 - part 2

Please create a website. It should consist of at least a few pages. Coding each of them please set as `utf-8`. Each page should be HTML 5 compliant and have your own unique title. Moreover, it should bear metadata, in particular a description and keywords (for positioning). The start page should contain links to other pages and should be written using page structure elements such as `article`, nested section and navigation.

1. Besides element from previous list, the following pages should use in a practical way such elements of the page structure as: `<nav>`, `<meter>`, `<details>`, `<summary>`, `<aside>`, `<main>`, `<footer>`.
2. Create a page that will contain the personal form with minimum 10 different types of input elements. Information in what format the fields should be filled in are to be placed on the right after the text field to be filled. The form should have an autocomplete option, which you need to get by using the `autocomplete` attribute. Example data such as:
 - a. name,
 - b. last name,
 - c. the month of birth (use the `<datalist>` element type for this),
 - d. e-mail address using `email`,
 - e. telephone using `tel`.
 - f. date of arriving (with calendar)
 - g. favor color
 - h. happiness level as a slider from 0 to 10
 - i. known languages as checkboxes
 - j. education level as radio buttons
 - k. url to personal webpage
 - l. etc.

In the case of an e-mail address, data validation should take place automatically on the client's side. Perform the validation of the phone number using the `pattern` attribute using a regular expression. After loading the form, the active element should be set to "Name" by means of the `autofocus` attribute. As required fields to be completed before submitting the form, set e. a. "last name" and "e-mail address" using the `required` attribute. The page should has been loaded with a hint to be completed (please use the `placeholder` attribute for this).

3. Validate the pages.
4. In developer tools check if the data was really send by a request when you click send button in the form.

Deadline 1: meeting 4 (max 100 points)

Deadline 2: meeting 5 (max 80 points)

Deadline 3: meeting 6 (max 50 points)
