

WSP - Web System Programming

Laboratory 05 – JS 1

JavaScript basics - part 1

For task 3 create a site with several HTML 5 elements. Use also some styles for table's elements.

1. Write one function `solveEq()` to solve 2 types of equations: quadratic one and linear one. When the function is called for 3 arguments `solveEq(a, b, c)` it solves $ax^2+bx+c=0$. When the function is called for 2 arguments `solveEq(a, b)` it solves $ax+b=0$. The result print on console. Test it for different cases.
2. Write a function `count()` which will count the length of first argument. If there are no arguments, the length is 0. For string – it have to be the number of characters, for any number (even float) – number of digits, for an array (indexed with integer numbers) – number of elements. The result print on console. Test it for different cases.
3. Create `movieArr`, array of objects of the same type describing the movie (title, director, duration, release date, etc.). Use the constructor function. Using the loop `for( ... of ... )` and the `write()` and `writeln()` methods for the `document` object, create a table (`<table>` element) in the HTML page, where the names of the movie's features will be in the headers, and the data for movies from the `movieArr` array in the following rows..

Deadline 1: meeting 7 (max 100 points)

Deadline 2: meeting 8 (max 80 points)

Deadline 3: meeting 9 (max 50 points)
