

WSP - Web System Programming

Laboratory 07 – Spring 1

Spring - part 1, Thymeleaf views, cotroller and service with CRUD operaions

Do the following tasks using Spring Framework.

1. You should create a POJO class to remember products (e.g. in a store). The product should contain id, name, category, price, description, etc.
2. In order to operate on a collection of products, you need to prepare a service class and implement CRUD operations. In the implementation of this class, **a hash table** should be used.
3. Create a product list view in the table, where in the last column there will be buttons for the operation:
 - a. show details
 - b. product editing
 - c. remove the productIn the table view it will be only some basics information. All the information will be in the rest views.
4. In the view from previous task there should also be a button (outside the table) for adding a new product.
5. Of course prepare all action (in controller) and views needed for all CRUD operation.
6. Prepare also a top menu in which it will be an option to view the table with products, the form for adding a product and a link to view with information about the author of the application.
7. For all the pages use **Thymeleaf Layout** as explained on the lecture.
