

WSP - Web System Programming

Laboratory 08 – Spring 2

Spring - part 2, Database connection, CRUD operations, relation one-to-many

Do the following tasks using Spring Framework with selected database.

- Create a collection of products stored in the database. You should design tables like:
 - Products
 - Categories
- The table views have to be like below:

Products

Id	Name	Weight [kg]	Price [pIn]	Category	Action
1	Bread	1	5,20	Baking	Details Edit Remove
2	Butter	0,25	7,00	Dairy	...

Category

Id	Name	Code	Action
1	Baking	B1	Edit Remove
2	Dairy	D2	...

- CRUD operations for products (adding a new product, displaying product details, modifying a product and deleting) will be handled using the buttons: Add product, Details, Edit, Delete. Prepare appropriate views for the operations.
- CRUD operations for category (adding a new category, modifying a category and deleting) will be handled using the buttons: Add category, Edit, Delete. Removing a category should result in deleting all products in that category from the database. Prepare appropriate views for the operations.
- In addition to the Id field, the product will have the following attributes: name as a text field, the weight as a floating point number, the price as a floating point number, product index as an integer, Category as a selectable field from the list. Category (besides Id) will have the following attributes: Name as a text field, Code as a text field.

Deadline 1: meeting 10 (max 100 points)

Deadline 2: meeting 11 (max 80 points)

Deadline 3: meeting 12 (max 50 points)
