

WSP - Web System Programming

Laboratory 10 – Node.js & Express.js

Implementation of operations on a collection of articles

Do the following tasks using Node.js and Express.js and selected database.

The program should manage a collection of articles stored in a database. Each article should have at least the following fields: id, name, category, price, description, etc.

1. The program should consist of a top-level menu with the following options: article list, add new article, and about. The menu should always be visible if the user has successfully completed the action.
2. The 'article list' option should present a table-like list of articles retrieved from the database with selected fields. An additional column should contain buttons for each article that allow:
 - a. to view full article information,
 - b. to change article data (except the id),
 - c. to remove an article from the collection.

For the latter two, after completing the operation, the user should return to the table page.

3. When adding a new article, the user should also return to the table page after adding the new article to the database.
4. The /about page should contain the application developer's details.
5. Protect the entire system from errors.
6. Add menu, table and form styling.

Deadline 1: meeting 13 (max 100 points)

Deadline 2: meeting 14 (max 80 points)

Deadline 3: meeting 15 (max 50 points)
