

# WSP - Web System Programming

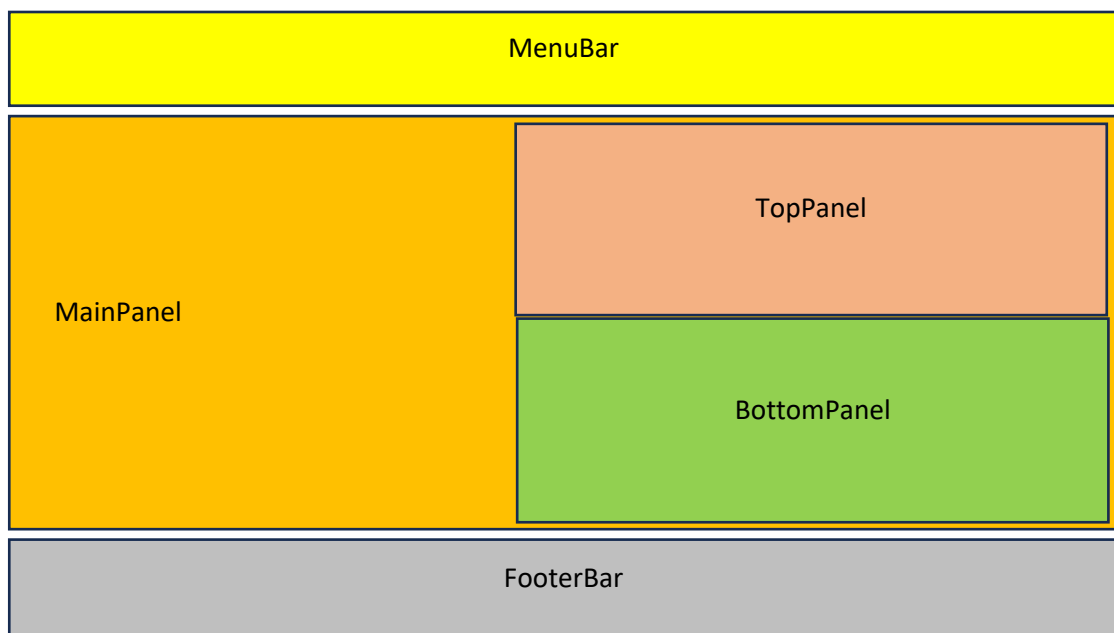

## Laboratory 11 – React+Vite 1/2

### Implementation of frontend with React+Vite

Do the following tasks using React and Vite.

The application should have a reading operation of collection of articles stored in a service. Each article should have at least the following fields: id, name, category, price, description, etc. All tasks must be done using props, hooks, callbacks etc.

1. The program should consist of a few components organized like below.

2. Fill MenuBar and FooterBar with a placeholder with a text and an image.
3. Create a service to return a collection of articles.
4. In the MainPanel (or App) read data from a service and present it as a list (or matrix) of tiles with basic information of articles (name and category).
5. Each tile should have two buttons (or other mechanism) to select whether the item details appear in the top or bottom panel.
6. Each of these panels shows either a placeholder or article data, and buttons to close the preview and perform a “switch” operation.
7. The “switch” operation means that the data displayed in both panels will switch places.

Deadline 1: meeting 14 (max 100 points)

Deadline 2: meeting 15 (max 80 points)
