

(S) Support for IT Project Management – Rules

Main rules:

1. Each student must make one presentation during the course.
2. The teacher assigns students to topics and areas.
3. The presentation is about one of the topics on the list.
4. The topics 1-11 have priority over the topics 12-14 when assigned to students.
5. Each topic 1-11 should be assigned to two students if possible. Each topic 12-14 may be assigned to one student. The assignment depends on the number of students in a group and is specified in a separate document managed by the teacher.
6. Each topic of number 1-11 covers two areas:
 - a. **specification of functionalities** related to a given topic (*preferably prepared and presented by one person*),
 - b. **comparative analysis** of the functionalities provided by the available solutions on the market (*preferably prepared and presented by different person*).
7. The presentation on the **specification of functionalities** related to a given topic should contain the following elements:
 - a. A List of user needs and specific software functionalities that respond to these needs.
 - b. The list of software functionalities should include the following:
 - i. name of the functionality,
 - ii. input and output information of the functionality,
 - iii. description of the purpose of the functionality,
 - iv. the level of significance of a given functionality expressed in the MoSCoW system.
 - c. UML Use Case diagram representing a set of functionalities related to a given topic and relationships between them.
7. The presentation on **comparative analysis** of the functionalities provided by the available solutions on the market should contain the following elements:
 - a. List of computer programs that have been analyzed:
 - i. name of the computer program,
 - ii. type of computer program (web application/standalone)
 - iii. computer program producer or service provider,
 - b. Functionalities comparison matrix
 - i. *rows*: names of the computer program,
 - ii. *columns*: functionalities,
 - iii. *fields*: information about the level and/or method of implementation.
 - c. Usability analysis in the context of the indicated functionalities.
 - d. Critical analysis summarizing available solutions.
8. The duration of the presentation should be 10-15 minutes, followed by a 5-10 minute discussion.
9. Completeness, substantive correctness, internal consistency, and communicativeness of the presentation will be assessed.
10. Failure to deliver a presentation means a 2.0 grade.
11. For technical reasons, I am asking that each pair of students have their presentations uploaded to the computer of one of the students and connected at the beginning of the topic presentation.
12. The final number of points is calculated according to the following rule:

$$P(\text{sem}) = W3 \times F3 + W4 \times F4,$$

where

F3 Assessment of the presentation of the assigned topic delivered during the seminar,

F4 Assessment of activity in discussing the topics presented during the seminar,

W3 = 0.6

W4 = 0.4

The following number of points can be obtained for:

- presentation: max 24 = 12 [points for functionality] + 12 [points for comparison]

(S) Support for IT Project Management – Rules

- active participation: $\max 24 = 8 \text{ [classes]} * 3 \text{ [points]}$

which gives:

- total weighted points: $\max 24 \text{ [points]}$

13. The final number of points for the seminar is normalized to the 100 points as the maximal one to form the total number of normalized points for the seminar.

Topics list:

1. Comparative analysis of business process modelling software
2. Comparative analysis of requirements management software
3. Comparative analysis of system modelling software
4. Comparative analysis of interface modelling software
5. Comparative analysis of software for scheduling an IT project
6. Comparative analysis of task allocation and accounting software
7. Comparative analysis of project implementation monitoring software
8. Comparative analysis of group communication software
9. Comparative analysis of risk management software
10. Comparative analysis of data archiving software
11. Comparative analysis of software integrated into a computing cloud
12. Meyers-Briggs Personality Tests
13. The Big Five Personality Tests
14. DISC Personality Tests
