PM Software – definition by Techopedia (1)

<https://www.techopedia.com/definition/13132/project-management-software/>

- Project management software is software used for project planning, scheduling, resource allocation and change management.
- It allows project managers (PMs), stakeholders and users to control costs and manage budgeting, quality management and documentation and also may be used as an administration system.
- Project management software is also used for collaboration and communication between project stakeholders.

PM Software – definition by Techopedia (2)

<https://www.techopedia.com/definition/13132/project-management-software/>

- Project management software performs the following basic functions:
 - Project planning
 - Task management
 - Document sharing and collaboration
 - Calendar and contact sharing
 - Bug and error management
 - Time tracking

PM Software – definition by Techopedia (3)

<https://www.techopedia.com/definition/13132/project-management-software/>

- Although project management software is used in a variety of ways, its main purpose is to facilitate the planning and tracking of project components, stakeholders and resources.
- Project management software caters to the following primary functions:
 - **Project planning:** To define a project schedule, a project manager (PM) may use the software to map project tasks and visually describe task interactions.
 - **Task management:** Allows for the creation and assignment of tasks, deadlines and status reports.

PM Software – definition by Techopedia (4)

<https://www.techopedia.com/definition/13132/project-management-software/>

- **Document sharing and collaboration:** Productivity is increased via a central document repository accessed by project stakeholders.
- **Calendar and contact sharing:** Project timelines include scheduled meetings, activity dates and contacts that should automatically update across all PM and stakeholder calendars.
- **Bug and error management:** Project management software facilitates bug and error reporting, viewing, notifying and updating for stakeholders.
- **Time tracking:** Software must have the ability to track time for all tasks maintain records for third-party consultants.

PM Software – definition by Mavenlink (1)

<https://www.mavenlink.com/resources/what-is-project-management-software/>

- **Project management** includes the tools and techniques required to deliver your projects successfully. Projects are comprised of stakeholders, their vision/goal, the resources required to achieve that goal, and management processes and tools to make sure you get there.
- **Project management** is key to this success. Project management includes the technology, methodology, and resources that enable project completion. Over time, technology and methodology have gotten incredibly sophisticated.
- **Project management software** helps managers control their costs and hit deadlines. It helps people deliver the projects they commit to. It even helps them track whether or not they've been paid on time and in the right amount. Project management software has many high-level bucket features.

PM Software – definition by Mavenlink (2)

<https://www.mavenlink.com/resources/what-is-project-management-software/>

- **Project management software** has many high-level bucket features. These can include:
 - Team Collaboration
 - User Dashboard
 - File Sharing
 - Calendar Share
 - Mobile App
 - Access Permissions
 - Project Management
 - Task Management
 - Task Assignment and Scheduling

PM Software – definition by Mavenlink (3)

<https://www.mavenlink.com/resources/what-is-project-management-software/>

- Project management software features:
 - Project Plan templates
 - Schedule Management
 - Gantt Charts
 - Project Accounting
 - Time and Expense Tracking
 - Budgeted Projects and Tasks
 - Invoicing and Online Payments
 - Rate Cards
 - Resource Management

PM Software – definition by Mavenlink (4)

<https://www.mavenlink.com/resources/what-is-project-management-software/>

- Project management software features:
 - Hard and Soft Resource Allocation
 - Resource Scheduling
 - Resource Shaping
 - Business Intelligence
 - Data Export
 - Real Time Analytics
 - Expert Build Reports
 - Custom Reporting
 - Trend Analysis and Forecasting

What are the Disadvantages of PM Software?

<https://www.mavenlink.com/resources/what-is-project-management-software/>

- Project management software has its cons too.
- Picking one system requires an investment, which means you need to carefully consider and determine which system will work for your unique workflows.
- The system you pick should be just as customizable as you need.
- You should consider the cost of time and possibly money to train your employees.
- Employee adoption of the technology you pick is critical to gain the highest return on your investment in a project management software, as well as avoid having employees not use the system out of lack of understanding its user interface and total functionality.
- You want your project management software to speed up processes, not create extra burdens on your team's time.

What are the Advantages of PM Software? (1)

<https://www.mavenlink.com/resources/what-is-project-management-software/>

- Project managers need specific tools to manage and deliver their projects on time.
- Traditional project management software helps these managers perform functions including managing project scope, cost, and resources.
- Modern collaboration software offers even more tools.
- These tools help reduce wasted time, such as time spent looking for files or data and time spent manually updating schedules and timetables.
- They need tools to share files, communicate in real time, and ensure all team players are working on one page.

What are the Advantages of PM Software? (2)

<https://www.mavenlink.com/resources/what-is-project-management-software/>

- Some tools reduce redundancy -- they consolidate systems, so that information exists in only one place.
- And they also avoid file redundancies, which can contribute to what some call a “versioning nightmare.”
- In addition to mitigating the number of differing files around, project management software also ensures teams use one method to track time, tasks, expenses, other budgeting items such as invoices, and more.
- Having one systems allows teams to work creatively within a given framework.

What are the Advantages of PM Software? (3)

<https://www.mavenlink.com/resources/what-is-project-management-software/>

- Moreover, with the onset of cloud-based project management software, organizations no longer have to work in a single physical location.
- They can easily work as a team while dispersed across geographies, while retaining the same access, updates, and collaboration levels.
- Software as a service (SaaS) project management solutions facilitate teamwork -- and thus project delivery, client satisfaction, and repeat business.

What are the Advantages of PM Software? (4)

<https://www.mavenlink.com/resources/what-is-project-management-software/>

- Finally, software automates your processes and provides a central hub to manage resources, tasks, schedules, projects, and communication.
- All this information living in one system gives you a huge opportunity to run progress reports -- whether daily, weekly, monthly, or quarterly.
- Today's advanced systems can offer real-time progress reports, so you can easily visualize and share information related to project health.
- This not only gives you insight into where you can adjust your resources to make smarter project-delivery decisions; it also enables you to give detailed, transparent responses to stakeholder questions.

How to Compare Project Management Software?

<https://www.mavenlink.com/resources/what-is-project-management-software/>

- Define what you want your project management software to do.
- This can be a combination of needs (e.g., time and expense tracking, resource planning, performance reporting,, specific integrations).
- Then begin your research for what is out there.
- Some trusted websites, such as **Capterra** and **CIO.com**, already provide reviews highlighting the best project management software out there, to save you time:
- You can read a couple recent reviews here:

Project Management Software Buyers Guide by Capterra (1)

<https://www.capterra.com/project-management-software/>

What is project management software?

- Project management software is now an umbrella term, encompassing a range of solutions from lighter work management tools up to robust portfolio management solutions. It's important to understand the differences between these types of software so you can choose the tool that best meets your needs.
- Work management software helps teams manage workflows, organize tasks and activities, and collaborate in a shared workspace. These tools capture work execution, facilitate collaboration, and provide status updates and views relevant to different stakeholders. Their target user is non-technical business professionals.
- True PM software helps project managers and organizations execute projects - unique initiatives with a set scope, timeline, budget and/or resources. These tools help businesses plan, monitor, and control costs, schedules, and resources so they can deliver value and meet project success criteria. Their target user is technical professionals, i.e., project managers.

Project Management Software Buyers Guide by Capterra (2)

<https://www.capterra.com/project-management-software/>

The benefits of project management tools

- **Better collaboration:** Projects often require collaboration between multiple stakeholders including team members, other teams, and external clients. Project management software enables effective collaboration to allow teams to quickly respond to project challenges and requests, as well as brainstorm on process improvement.
- **Streamlined project management processes:** Project management software offers the ability to create tasks, assign them to people, and track the status using dashboards. Real-time file sharing and collaboration tools save time. Business leaders have better control of their processes and can track project performance across different departments.
- **Accurate budget management:** Project management software helps businesses track estimated vs. actual budgets so they can proactively identify and address areas that exceed the budget.

Project Management Software Buyers Guide by Capterra (3)

<https://www.capterra.com/project-management-software/>

Typical features of project management software

- **Collaboration tools:** Manage communication both within the team and externally. Some systems also provide built-in messaging tools.
- **File sharing:** Upload different types of files such as documents, images, and spreadsheets, and share them with teammates.
- **Project tracking:** Track the real-time progress of a project on dashboards. Some software features Gantt Charts for tracking multiple stages of a project.
- **Product planning:** Create and implement product strategies.
- **Task management:** Create tasks, assign them to people, and work together on the action items.
- **Track completion rates:** Manually log the percentage of a task completed, which helps users calculate the total time required for completion.
- **Resource management:** Allocate resources in a project including team workers, contract workers, and physical inventories.
- **Time and expense tracking:** Log the total time and money spent on a project and compare it with allocated budgets.

Considerations when purchasing project management tools

The cost of project management software:

- Most project management tools in the market are priced on a "per user, per month" or "per month" basis, and can be broken down into three pricing tiers based on their "per user, per month" starting price.
- Price ranges:
 - \$0 - \$7
 - \$7 - \$10
 - \$10+
- The above list mentions pricing for the base plans of most project management tools.
- An enterprise, or premium product may include some additional features such as time tracking, desktop apps, Gantt charts, resource management, and workflow orchestration.

Project Management Software Buyers Guide by Capterra (5)

<https://www.capterra.com/project-management-software/>

Considerations when purchasing project management tools

Cloud-based vs. on-premise:

- Cloud-based and on-premise project management tools vary in a number of ways.
- An on-premise system incurs capital expenses, which includes one-time installation cost and update costs.
- On the other hand, a cloud-based software offers subscription pricing model, which usually incurs monthly or annual costs.
- Also, a cloud-based solution provides ease of access as users can remotely login from their devices using web browsers or mobile apps.
- Buyers should assess their requirements and make purchase decisions accordingly.

Project Management Software Buyers Guide by Capterra (6)

<https://www.capterra.com/project-management-software/>

Considerations when purchasing project management tools

Total cost of ownership:

- Apart from the pricing mentioned on the product website, there are often additional costs related to purchasing a project management system.
- These can include training, implementation, and future upgrades.
- Before making a software purchase, buyers should consider the total cost of ownership.

Project Management Software Buyers Guide by Capterra (7)

<https://www.capterra.com/project-management-software/>

Considerations when purchasing project management tools

Feature requirements:

- Some project management system features are suited to specific business needs.
- For example, a Gantt chart is a project planning and tracking tool that helps users track the status of tasks across multiple stages of the project.
- Issue tracking is another useful feature that helps users track customer issues, technical bugs, and error reports.
- Users with such specific needs should evaluate products that include these features.
- Capterra's project management software directory allows you to search for software by desired features, such as Agile methodologies, Kanban boards, and milestone tracking.

Relevant project management software trends

- **AI-enabled chatbots** are entering the project management software space: Chatbots are conversational user-interface technologies that help users automate project management system processes such as scheduling meetings and pulling up reports.
- This allows users to automate repetitive administrative tasks, making processes more efficient.
- **Social collaboration tools** are on the rise: With evolving customer needs, businesses are constantly searching for innovative ways of working. A social collaboration solution offers features such as hashtags and "@" mentions, which allow team members to interact faster and better.
- A Gartner report states that "employees are increasingly using social collaboration tools rather than formal project management products to keep their projects on track".

On-Premises vs On-Demand Software

On-Premises Software

- On-premises software is a type of software delivery model that is installed and operated from a customer's in-house server and computing infrastructure. It utilizes an organization's native computing resources and requires only a licensed or purchased copy of software from an independent software vendor.
- On-premises is the software and technology that is located within the physical confines of an enterprise – often in the company's data center.
- Also referred to as "on-prem" or „on-premise”, on-premises software is the more traditional method for working with enterprise software, and typically requires a software license for each server and/or end user that will be working with the software.

On-Premises vs On-Demand Software

On-Premises Software

- On-premises software is one of the most common, traditional methods of using enterprise and consumer applications.
- On-premises software typically requires a software license for each server and/or end user. The customer is responsible for the security, availability and overall management of on-premises software. However, the vendor also provides after sales integration and support services.
- On-premises software is more expensive than on-demand or cloud software because it requires in-house server hardware, capital investment in software licenses, in-house IT support staff and longer integration periods. However, on-premises software is considered more secure, as the entire instance of software remains on the organization's premises.

On-Premises vs On-Demand Software

On-Demand Software

- On-demand software is a type of software delivery model that is deployed and managed on a vendor's cloud computing infrastructure and accessed by users over the Internet as and when required.
- On-demand software enables a user/organization to subscribe to software on a pay-as- you-go, monthly billing method.
- On-demand software is also known as **Software as a Service (SaaS)**, **online software**, **off premises software** and **cloud-based software**.

On-Premises vs On-Demand Software

On-Demand Software

- On-demand software provides the same or enhanced capabilities compared to on-premises software but the main benefit is that companies don't have to buy their own software. The customer pays a flat monthly fee to use the software and can decommission services anytime.
- On-demand software also eliminates the need for in-house server hardware and other operational expenses, as well as the staff required to manage the software.
- The on-demand software can be accessed anytime globally from the Internet in a standard Web browser on most end devices such as computers, tablets and smartphones. The vendor, in turn, is responsible for ensuring the software's availability, back-end security and management and versioning control.

On-Premises vs On-Demand Software

	SaaS	On-Premises
Cost	Pay as you go, per user, per month, etc.	Up-front capital costs for hardware, software licensing, lab space, air conditioning, etc.
Customization	Limited customization	Somewhat customizable depending on software vendor
Hardware	Hardware and software owned reside at provider site	Customer must provide hardware and system platforms to run apps

On-Premises vs On-Demand Software

	SaaS	On-Premises
Security	Access to SaaS apps is via Internet, creating security risks	Less risky because of on-premises location
Mobile access	Accessible via browsers running on mobile devices	Limited access to business applications via browsers running on mobile devices
Integration	Limited integration, even though this is an important requirement	Integration with existing software is commonplace
Control	SaaS provider controls systems and is entrusted with customer data	Control of systems and data
